

Recycled rubber bike lane separators

- > TCT-Europe manufacture a recycled rubber lane separator targeted at the bike lane market.
- > The units come in black or high visibility yellow with high visibility strips.
- > The lane separator sections lock into each other with end pieces so can be laid to any length.
- > The system comes with flexible vertical plastic posts with reflective tape that lock into the bases and provide additional visibility and protection.
- > The lane separators can be laid as a continuous line or spread at intervals along the road or walkway. This provides a physical barrier to protect cyclists but also prevents pedestrians from being trapped on the wrong sides of a barrier system in built up areas.
- > The lane separators are easily mounted using lag bolts, rebar spikes or galvanised spikes.
